Tasks

Name: Horriya Noor

Sap ID: 64048

Semester: 4th

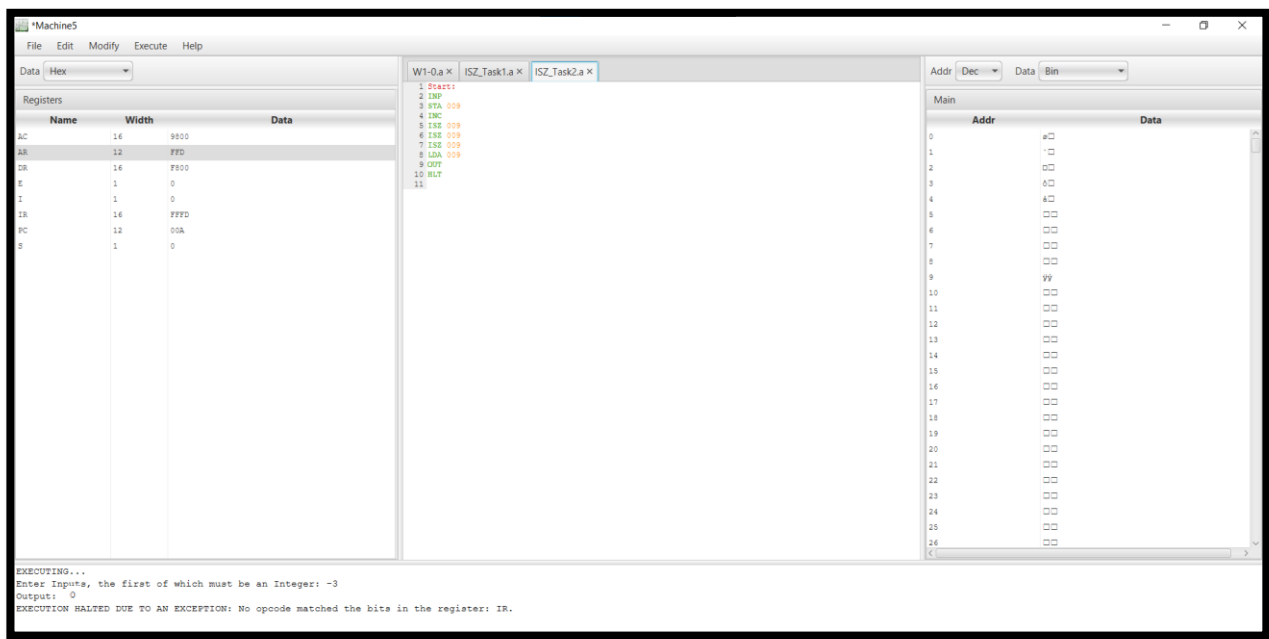

Department: BSCS

MARCH 3, 2026

Task Requirements:

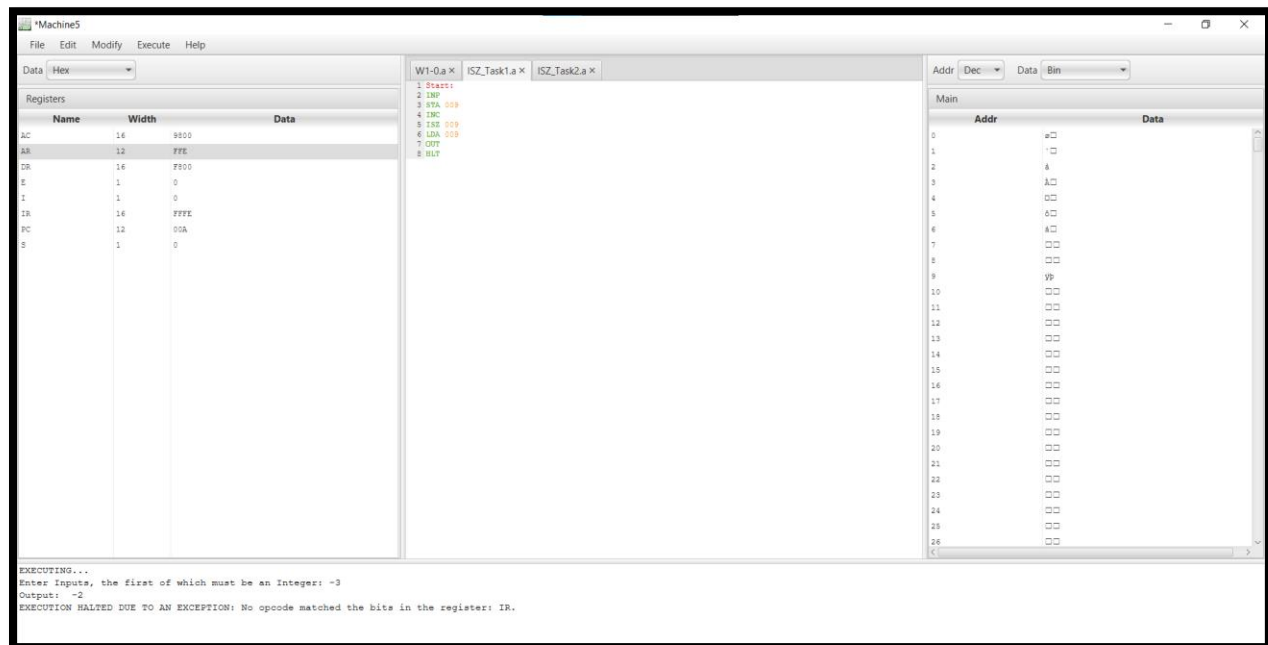

1. Set memory location 009 to -3. Increment by 3 and make it 0. Perform ISZ operation. Show the results.
2. Show that ISZ doesn't skip when result $\neq 0$

Task # 1:

We take the value from the user store that value from accumulator to memory address 009. After increment, the value is stored back to accumulator. If the result is result is 0, it skips the next line of code and if the result is not 0, it proceeds to the next line normally.

Task # 2:

We took the integer from the user and save it into the memory address which we have decided as 009. Then we applied the operation of Increment which adds 1 to the value. We are using micro instruction of ISZ (Increment and skip if zero). It adds 1 to the values and store at memory address 009. If the value is zero, it will ship the next instruction.
